

We are happy to announce that we have developed a new high-end sprit, called the MK3 Hyperflex.

We have been able to develop an even more flexible sprit by combining a 28mm tube with a very thin wall thickness. The characteristics of the used high yield alloy, the extrusion manufacturing process and the used thicknesses makes the sprit +- 20% more flexible compared to the well known MK3 Flex sprit.

This sprit weighs less than 500 gram and is +- 30% lighter compared to the MK3 Flex sprit.

Your Optimist rig can be further optimized for those who prefer a more dynamic leech which opens more easily. This can be useful when sailing in strong winds or on high waves.

Material: Superior Lanurep space craft alloy  
Anodized: Top grade dark grey.
